1. Embedded Software development for control panel

Period: December 2022 – February 2023

Category: Embedded software development

Company: Proekspert AS, Tallinn, Estonia

Technology: C, C++, MyDrive® Insight, Azure pipelines, JTAG, Hardware

Description:

I actively participated in the development of a control panel for Danfoss frequency converters, which play a crucial role in controlling the speed of different motor types, including asynchronous, PM, and Synchronous Reluctance motors. Our primary objective was to create a next-generation Danfoss control panel with an enhanced user interface, improved fonts, intuitive navigation, and optimized utilization of RAM and flash resources. We aimed to deliver a solution that not only provided a superior user experience but also minimized resource requirements.

In my role, my focus revolved around various aspects, including elaborating on system architecture, assembling boards, wiring components, creating models, establishing hardware connections, creating the menu structure, and diligently identifying as well as resolving any encountered bugs or issues.

2. Embedded Software development for frequency converters

Period: June 2022 – November 2022

Category: Embedded software development

Company: Proekspert AS, Tallinn, Estonia

Technology: C, C++, MyDrive® Insight, Azure pipelines, JTAG, Xilinx Vivado, Lauterbach debugger and TRACE32

Description:

Worked on embedded software development for Danfoss frequency converters, which are utilized to control the speed of various types of motors including asynchronous, PM, and Synchronous Reluctance motors. My focus was primarily on engineering, commissioning, and monitoring activities related to the iC7 Series drive products. This encompassed various tasks, such as assembling boards, conducting thorough feature testing, and diligently identifying and resolving any encountered bugs or issues.

One significant bug that I addressed was in the hardware abstraction layer unit tests. By troubleshooting and debugging the issue, I successfully resolved the bug, ensuring the proper functioning of the software.

Additionally, I integrated a RAM driver without overprovisioning, optimizing the utilization of available resources. This integration helped enhance the performance and efficiency of the software running on the frequency converters.

3. Desktop application for creating a custom file type

Period: January 2022 – May 2022

Category: Desktop application development

Company: Proekspert AS, Tallinn, Estonia

Technology: Qt, C++, Qt Creator

Description:

Designed and developed a desktop application using Qt/C++ specifically for Windows, which enables users to create and manipulate a custom file type. This custom file format incorporates a range of options and binary data related to firmware various types of motors, including asynchronous, PM (Permanent Magnet), and Synchronous Reluctance motors.

The application allows users to open and modify the firmware file within the app itself. This feature provides a seamless and user-friendly experience, empowering users to make necessary adjustments to the firmware settings with ease.

The screenshot shows the 'EDU File Creator' application window. It has a menu bar with 'File' and 'Help'. Below the menu bar are two tabs: 'Pre-update Validation' (selected) and 'Option Update'. The main content area is divided into three sections:

- Mask Validation:** Contains an information icon, a description of mask validation, and a table with columns 'Parameter', 'Index', and 'Mask'.

Parameter	Index	Mask
1600	0	***108***W3***B***F***A*****
- Token Validation:** Contains an information icon and a table with columns 'Token' and 'Value'.

Token	Value
F	1
Y	7
- Option Software Versions:** Contains an information icon, two checkboxes ('Option A' is checked, 'Option B' is unchecked), and two sets of 'Min' and 'Max' value fields, both showing '00.00' and '99.99'.

At the bottom right of the window are 'Save...' and 'Cancel' buttons.

4. Smart-home mobile application

Period: August 2021 – January 2022

Category: Mobile application development

Company: Proekspert AS, Tallinn, Estonia

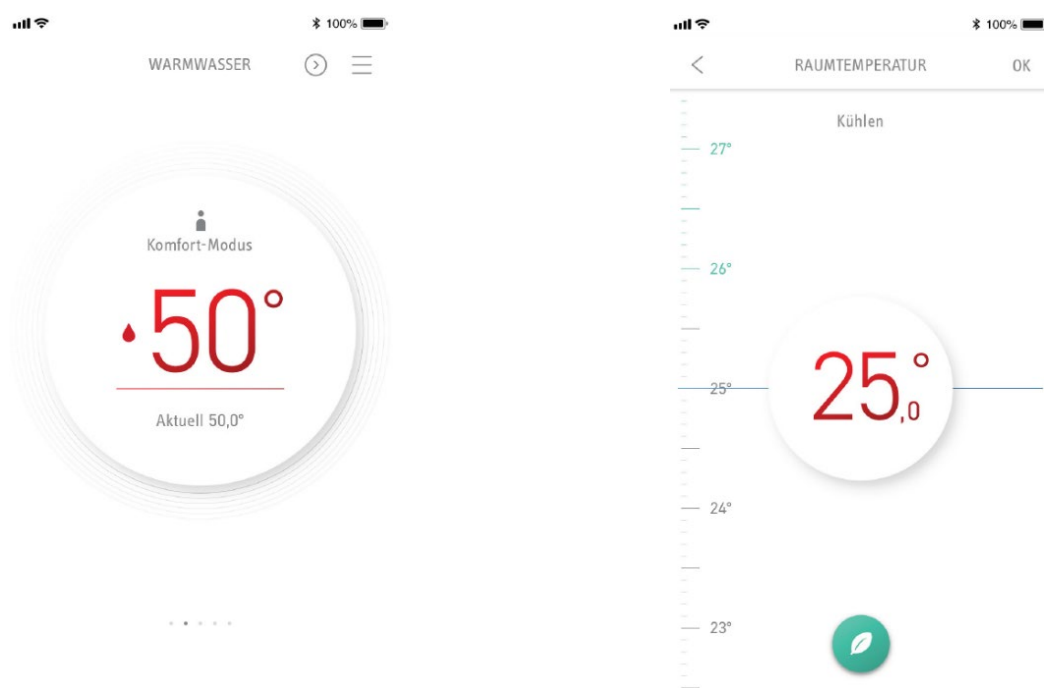

Technology: QML, Qt, C++, Qt Creator, Qt Web Sockets, FlatBuffers

Description:

Developed a Minimum Viable Product (MVP) for a smart-home application designed to manage various types of water heaters for STIEBEL ELTRON GmbH & Co. KG (Germany). The application was developed for both Android and iOS platforms, utilizing the Qt framework, QML for the user interface, and C++ for the underlying logic.

To ensure seamless data synchronization between the mobile app and Azure server, Qt Web Sockets were used for efficient real-time communication. This provided up-to-date information on water heaters' status and settings.

For data versioning and compatibility, FlatBuffers, a powerful serialization library, was implemented. It reduced memory usage and improved performance while allowing easy definition and evolution of data models using schemas.

5. Porting QML UI to Qt

Period: January – March 2021

Category: Application Programming

Company: OctoNus Software, Moscow, Russia

Technology: QML, Qt, C++, Visual Studio

Description:

Ported part UI of the module for 3D visualization and editing of facet types of diamond model (QML, Qt, C++) from QML to Qt. Facet Types module is used to display and modify types of facet and their properties. These facet types are using in other parts of a company's desktop software solution for diamond scanning and processing: in reports, in polishing process by cutters. It's very useful and flexible for user to create custom facet types for a wide variety diamond cuttings.

6. Semipolish Report

Period: October – December 2020

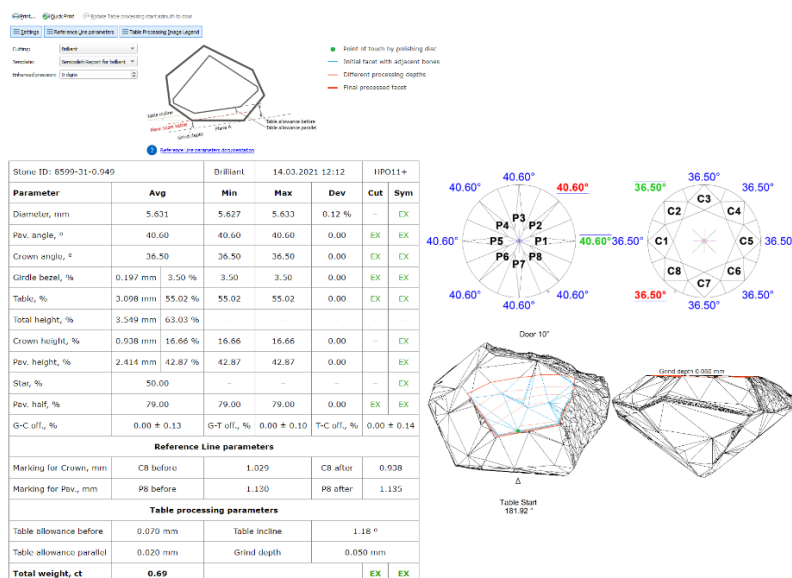

Category: Application Programming, Web Development

Company: OctoNus Software, Moscow, Russia

Technology: C++, GDI+, 2D, 3D-geometry, algorithms, Qt, Qt Web Engine, HTML, CSS, JavaScript, Visual Studio, Qt Visual Studio Add-in

Description:

Designed and developed Semipolish Report (HTML/CSS/ JavaScript). It allows controlling (both visually and via parameter values) a Table facet polishing process to obtain a Table plain of a target diamond from a rough Stone. Table facet is the large, horizontal facet on the top, the table facet acts as a window into the interior of the gem. The report includes the Rotate table processing start azimuth to door control (presented if the hardware is connected) to simplify Table processing for cutters. Developed and implemented a GUI panel for browsing the report using Qt WebEngine, is displayed in the Scene. Reports are generated based on the template and filled by calculated data and images that are created using Windows GDI+, the range of 2D and 3D algorithms.

7. Distances between Models in Comparative I3D Report

Period: September 2020

Category: Web Development, 2D, 3D-geometry, algorithms, 3D-Graphics, Application Programming

Company: OctoNus Software, Moscow, Russia

Technology: JavaScript, HTML, CSS, C++

Description:

Comparative Interactive 3D Report (HTML/CSS/JavaScript) is used for viewing of diamond models and its different parameters in 3D scene – inside a GUI panel based on Qt WebEngine. Implemented 2 new modes for displaying distances between models at comparison of 2 models (Current and Reference) in Comparative I3D Report. It shows how each pair of corresponding models' facets are close to each other. It's used, for example, to find the best diamond model to process or to control the current stone process state.

8. Integration of Desktop Application with Cloud

Period: May – August 2020

Category: Application Programming, Web Development

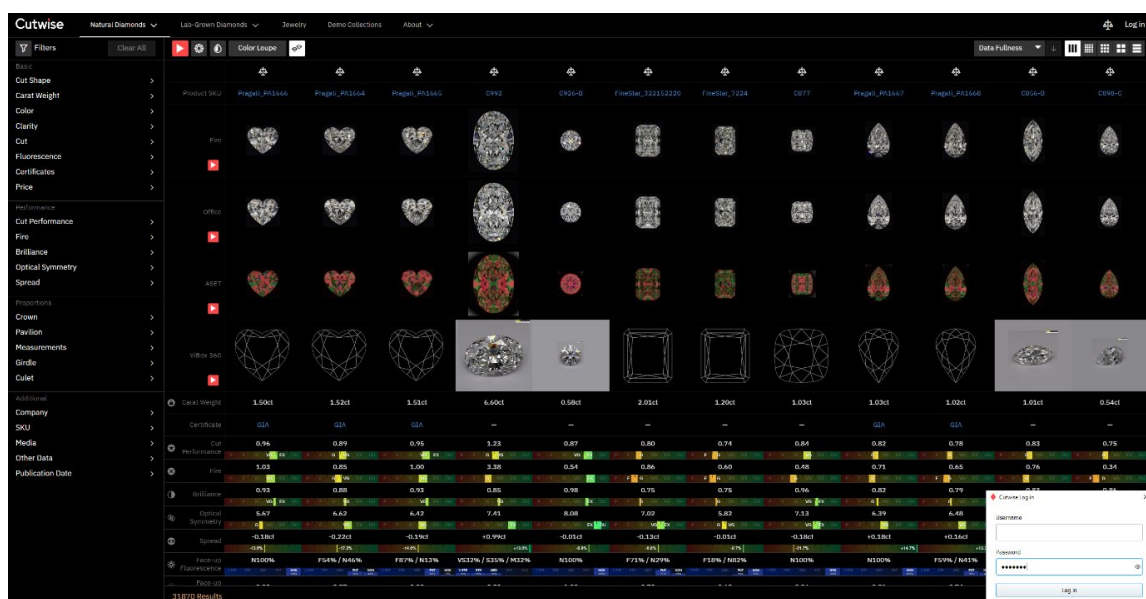

Company: OctoNus Software, Moscow, Russia

Technology: C++, Visual Studio, Asynchronous Programming, HTML, CSS, JavaScript,

Qt, Qt Visual Studio Add-in

Description:

Developed and implemented an architecture (C++) and a GUI (Qt) for integration of a company's desktop software solution for diamond scanning and processing that operating on Windows OS with a company's cloud <https://cutwise.com/>. Data generated in the application (scan and diamond 3D models, different type of reports [HTML/CSS/JS], spectrums, metadata) is send to the cloud, then it becomes available for different diamond processing companies, distributors and customers. The application interacts with a C++ client of a permanent Windows service to login users, upload files and obtain statuses. The service sends data to the cloud in his turn. I developed parts associated with data generation and preparation, interaction the desktop application with the client of the Windows service.

9. Support and Enhance Report Generation Module

Period: January – April 2020

Category: Application Programming, Web Development

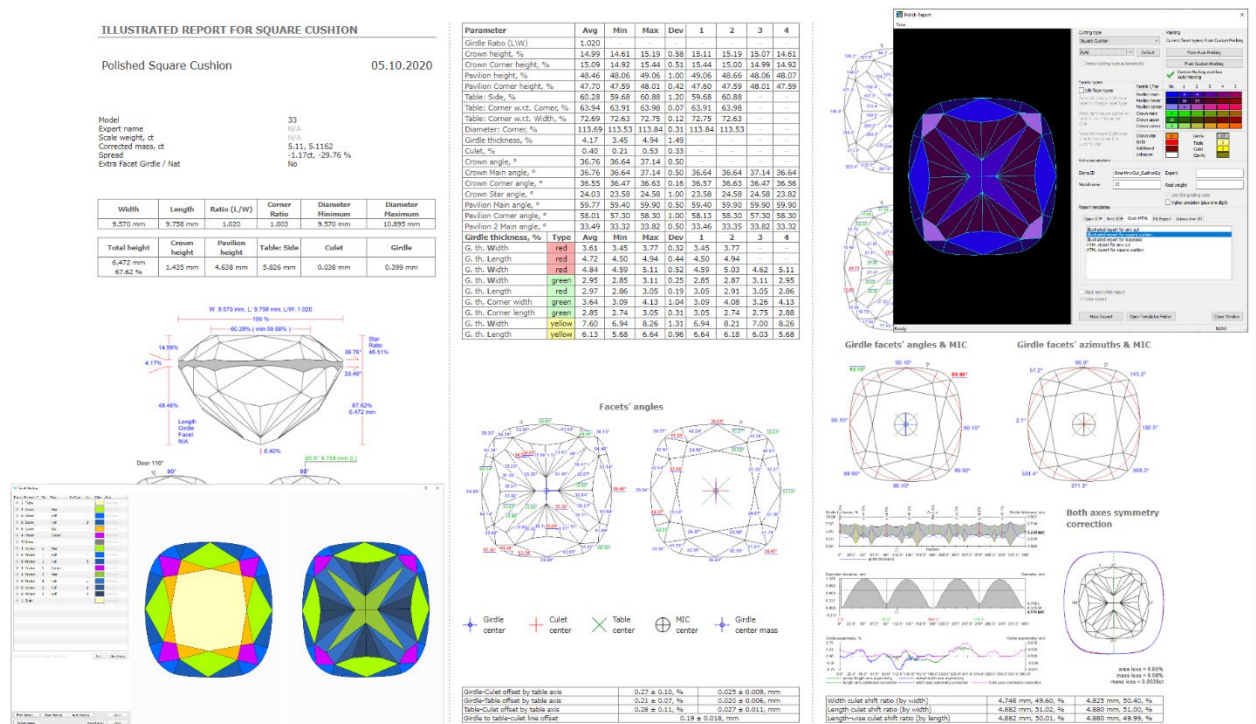

Company: OctoNus Software, Moscow, Russia

Technology: C++, Visual Studio, HTML, CSS, JavaScript, QML, Qt

Description:

Supported and enhanced Report Generation Module of a company's desktop software solution for diamond scanning and processing that operating on Windows OS.

Developed new features and fixed bugs in different types of reports (HTML and Word based) including implementation of logic (C++), GUI (MFC and QML) and HTML/CSS/JS report templates. Adapted HTML reports for mobile devices. Enhanced module for 3D visualization and editing of facet marking of diamond model (QML, Qt, C++) and widely integrated it with different parts of the application.

10. Refactoring of Models Comparison Engine

Period: November – December 2019

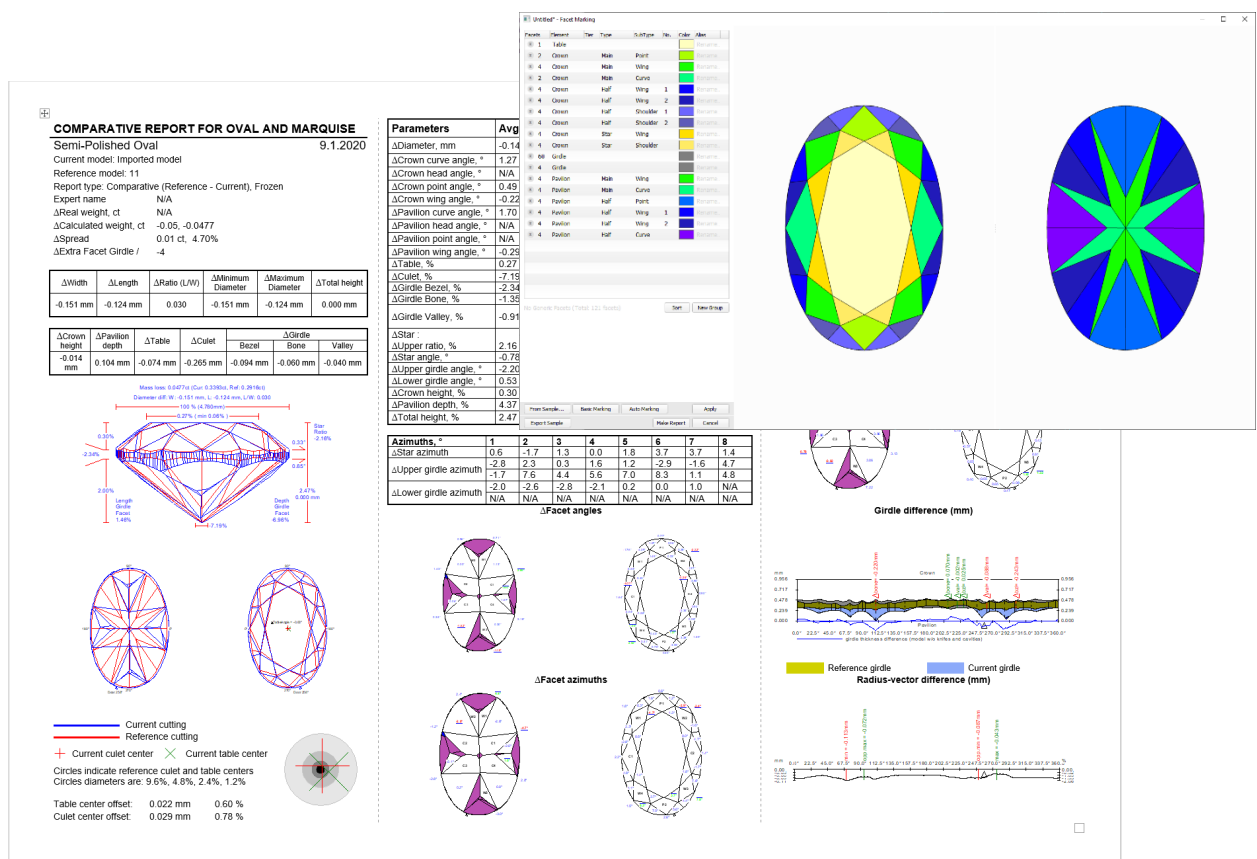

Category: Application Programming

Company: OctoNus Software, Moscow, Russia

Technology: C++, Visual Studio

Description:

Refactored of a diamond models comparison engine (C++) in a company's software solution for diamond scanning to scale the engine using in different dynamic libraries. Added support of multithreading in the engine. It has already been used by several existing software features.

11. Solutions Report

Period: July – August 2019

Category: Application Programming, Web Development

Company: OctoNus Software, Moscow, Russia

Technology: C++, Qt, Qt Web Engine, Qt WebChannel, multithreading, ReactJS, HTML, CSS, JavaScript, Visual Studio, Qt Visual Studio Add-in

Description:

Designed and developed Solutions Report (ReactJS/JavaScript/ HTML/CSS) for viewing of photorealistic diamond images and its different parameters in a scene. Developed and implemented a GUI panel for browsing the report using Qt WebEngine. The report exchanges data with the Qt GUI panel and a core C++ program via Qt WebChannel. User can add and remove diamond solutions in/from the report. Photorealistic diamond images are added into the report dynamically when they have been calculated. Integrated the panel in a company's software solution for diamond scanning. The panel was developed within the Visual Studio IDE for Windows platform.

12. Visualization of Diamond Girdle Thickness in Interactive 3D Report

Period: May 2019

Category: Web Development, 3D-Graphics, Application Programming

Company: OctoNus Software, Moscow, Russia

Technology: JavaScript, HTML, CSS

Description:

Interactive 3D Report (HTML/CSS/JavaScript) is used for viewing of diamond models and its different parameters in 3D scene – inside a GUI panel based on Qt WebEngine. Fixed visualization of diamond girdle thickness in Interactive 3D Report for different diamond shapes. Developed final calculations of girdle thicknesses for Interactive 3D Report based on a precalculated report data. Implemented a legend for the report.

13. Report for Comparison Scanned Diamond Models

Period: April 2019

Category: Application Programming

Company: OctoNus Software, Moscow, Russia

Technology: C++, Qt, Visual Studio, Qt Visual Studio Add-in

Description:

Developed a report for comparison scanned diamond models using C++. The report is used to check repeatability of model building by our scanning equipment. The report is generated to a text file based on INI templates with different diamond parameters.

Created detailed and brief (with main diamond parameters) report templates.

Implemented calculation of parameters' statistics. Cumulated reports could be exported to Microsoft Excel. Integrated the report generation feature in company's software solution for diamond scanning.

14. Facets Multi-Selection Tool

Period: November 2018 – January 2019

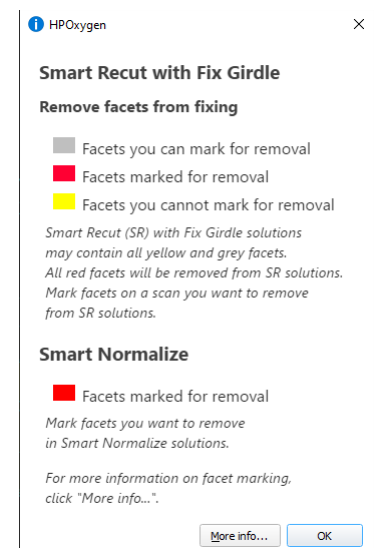

Category: Application Programming, 3D- Graphics, Web Development

Company: OctoNus Software, Moscow, Russia

Technology: C++, OpenGL, Qt, Qt Web Engine, Visual Studio, Qt Visual Studio Add-in, HTML, CSS, JavaScript

Description:

Designed and developed a tool for facets multi-selection in 3D scene using C++ (containers, algorithms), OpenGL. User could rotate a diamond model and select "undesirable" facets. Selected facets are used for several algorithms of diamond models creation, special processing methods are applied for these facets inside the algorithms. Also developed a hint dialog for this functionality using Qt WebEngine and HTML/CSS/JavaScript.

15. Polish Report for Cylinder

Period: October 2018

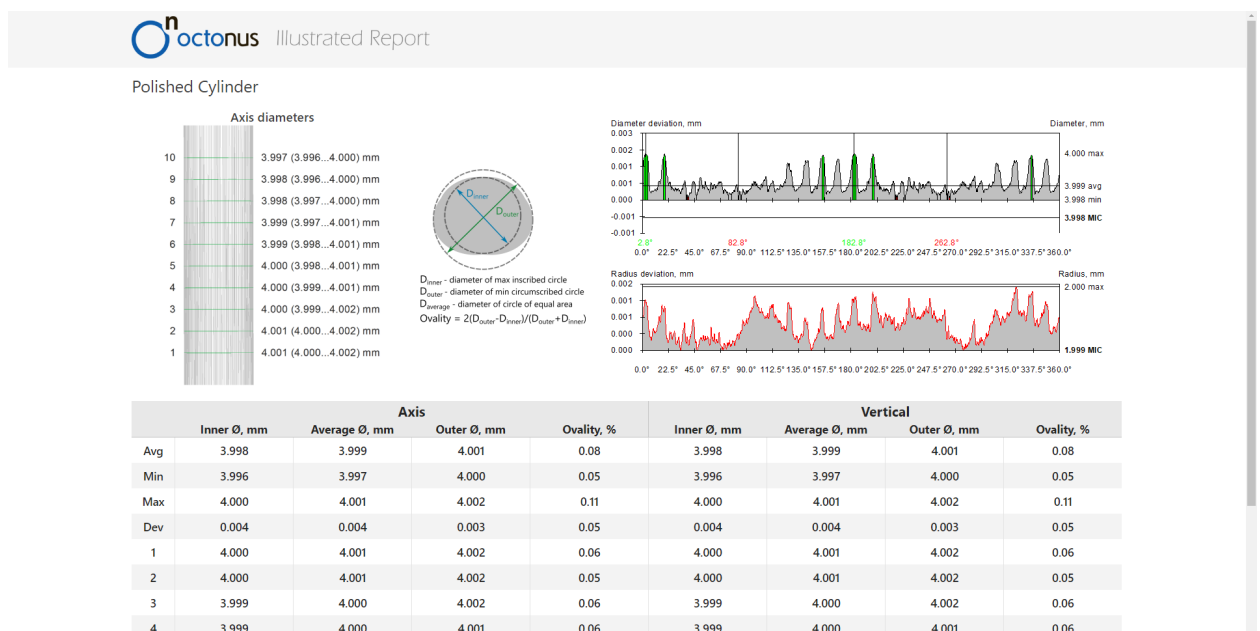

Category: Application Programming, 2D- Graphics, Web Development

Company: OctoNus Software, Moscow, Russia

Technology: C++, GDI+, HTML, CSS, JavaScript, Visual Studio

Description:

Designed and developed a HTML/CSS/JavaScript report template for viewing of a polished cylinder's parameters (diameters). Reports are generated based on the template and filled by calculated data and images that are created using Windows GDI+. Implemented drawing of a cylinder overview picture with sections perpendicular to cylinder axis and by vertical using C++ and GDI+. The created report is automatically opened in the default system browser.

16. Interactive 3D Report

Period: October 2017 – July 2018

Category: Web Development, 3D-Graphics, Application Programming

Company: OctoNus Software, Moscow, Russia

Technology: HTML, CSS, JavaScript, C++, Qt, Qt Web Engine, Qt WebChannel, Visual Studio, Qt Visual Studio Add-in

Description:

Integrated Interactive 3D Reports (HTML/CSS/JavaScript) for viewing of diamond models and its different parameters in a scene. Developed and implemented a GUI panel for browsing HTML-based reports using Qt WebEngine. Fixed some Axis Symmetry issues. Reports Implemented GUI for comparing two models in Interactive 3D mode. Reports exchange data with the Qt GUI panel, a core program C++ and between each other via Qt WebChannel. Integrated the panel in a company's software solution for diamond scanning. The panel was developed within the Visual Studio IDE for Windows platform.

17. HTML-based Faceting Report

Period: July 2017 – September 2017

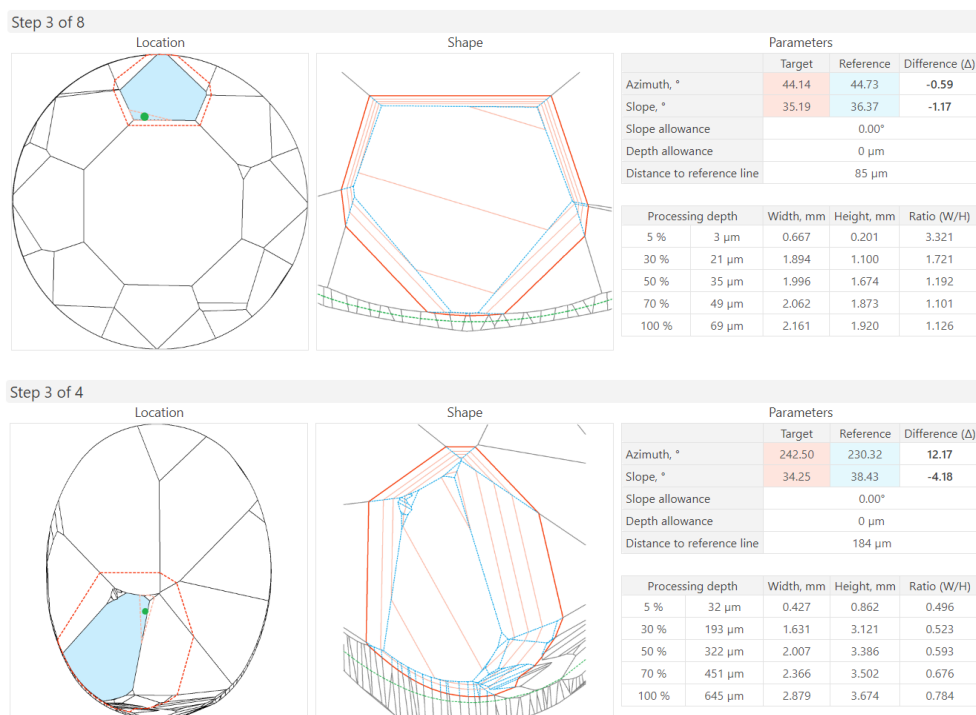

Category: Application Programming, 2D- Graphics, Web Development

Company: OctoNus Software, Moscow, Russia

Technology: C++, GDI+, HTML, CSS, JavaScript, JSON, Qt, Visual Studio

Description:

Designed and developed a HTML/CSS/JavaScript/JSON report template for viewing of faceting plans for stones (processing sequence of facets and cutting results), a report manager for reports generation and a Qt GUI panel to configure them. Reports are generated based on the template and filled by JSON data and images that are created using Windows GDI+. The created report is automatically opened in the default system browser. Integrated the workflow in company's software solution for diamond scanning.

18. Centralized Settings of Diamond Scanning Software

Period: August 2016 – July 2017

Category: Architecture Design, Application Programming

Company: OctoNus Software, Moscow, Russia

Technology: C++11, STL, Qt, Qt Creator, Visual Studio, QtWinMigrate,

Qt Visual Studio Add-in

Description:

Designed, developed and implemented an architecture and a GUI for centralized settings of a company's software solution for diamond scanning. The settings dialog has a structure with categories and pages. Categories and pages are sorted by their weight coefficient. The settings GUI supports filtering pages by key phrases. Pages could be exported from different plugins (libraries) of the program and embedded in the settings dialog. The GUI was realized within Qt Creator IDE and moved into a separate library using the Visual Studio IDE.

19. HTML-based Diamond Reports

Period: February 2016 – June 2016

Category: Application Programming, Web Development

Company: OctoNus Software, Moscow, Russia

Technology: C++, Qt, Qt WebEngine, Visual Studio, QtWinMigrate, Qt Visual Studio

Add-in, HTML, CSS, JavaScript

Description:

Designed and developed HTML/CSS/JavaScript report templates for viewing of diamond parameters and grades. Report templates were created for different types of diamond cuttings. Developed and implemented a GUI panel for browsing HTML-based reports using Qt WebEngine. Integrated the panel in a company's software solution for diamond scanning. The report panel is automatically opened after scanning. The panel was developed within the Visual Studio IDE for Windows platform.

20. Asynchronous Logger and GUI Panel for Log Messages

Period: November 2015 – February 2016

Category: Architecture Design, Application Programming

Company: OctoNus Software, Moscow, Russia

Technology: C++11, g3log, STL, Qt, Qt Creator, Visual Studio, QtWinMigrate, Qt Visual Studio Add-in

Description:

Integrated an asynchronous C++11 logger (g3log) in a company's software solution for diamond scanning. Designed, developed and implemented a submodule in a separate library that logs messages to files and in a GUI panel. The logger captures messages from all libraries of the program, it helps to determine a current state of scanning workflow. Implemented a rotation policy of log files. Designed, developed and implemented a GUI panel in a separate library for viewing log messages in real time. The panel supports filtering messages by log levels, searching messages by keywords and sorting messages by log parameters. The GUI was realized within Qt Creator IDE and integrated in a MFC panel using the QtWinMigrate framework. The logger and the GUI panel were developed within the Visual Studio IDE for Windows platform.

21. Interactive 3D Reports Client

Period: August 2015 – October 2015

Category: Application Programming, Installer Development

Company: OctoNus Software, Moscow, Russia

Technology: C++11, Qt, Qt Creator, XML, Inno Setup, Web browsers

Description:

Developed, developed and implemented a Windows app that allows scanner operators and cutters find, open and operate with HTML5-based Interactive 3D Reports from their workstations. The software is used to find and view previously generated reports stored on a network location or a local disk for a stone with a specific identifier. Metadata of reports are represented in XML format. Most of the modern web browsers are supported by the reports client. The application was realized within the Qt Creator IDE using C++11. An installer for the software was developed using Inno Setup.

22. Set-Top Boxes Software

Period: August 2010 – August 2015

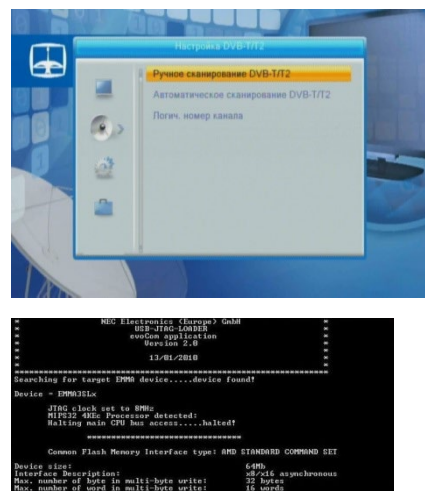

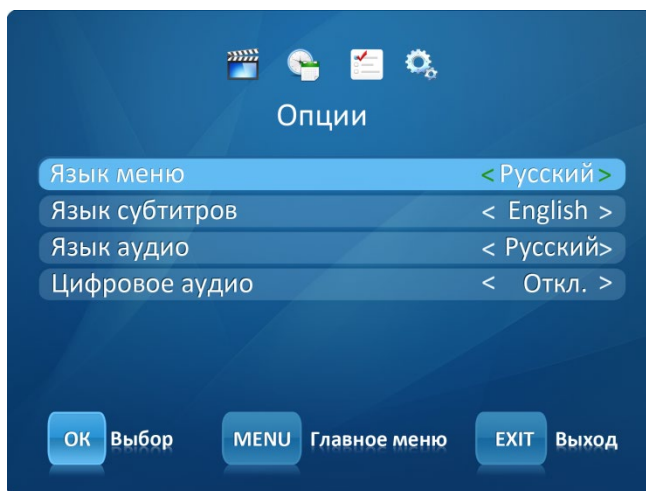

Category: Embedded Software Development and Testing

Company: Moscow Scientific Research Television Institute, Moscow, Russia

Technology: C, C++, Shell script, Makefiles, DirectFB, Cross Compilers, Embedded Linux, DVB-T/T2, IPTV, VirtualBox, Minicom, JTAG

Description:

I was responsible for developing, refactoring and testing applications for DVB-T/T2 set-top boxes based on Renesas Electronics, ST Electronics, NXP Semiconductors, ALi Corporation and HiSilicon Technologies platforms. Worked in a development team that has been designing set-top boxes using a variety of the latest digital TV technologies. Had been developing and testing set-top boxes software utilizing C, C++, Shell script, Makefiles and Cross Compilers. The set-top boxes are based on Embedded Linux. Configured and started a HiSilicon 4K platform with support of an Android Operating System. Started a NXP Semiconductors IPTV set-top box and tested it using VLC media player. Tested Set-Top-Boxes according the Nordig specifications. Had been configuring development environment and installing SUSE Linux, Fedora Linux, Ubuntu. Had been finding and fixing faults in set-top boxes via Minicom, JTAG.

23. Aerodynamic Measurements Software

Period: January 2015 – April 2015

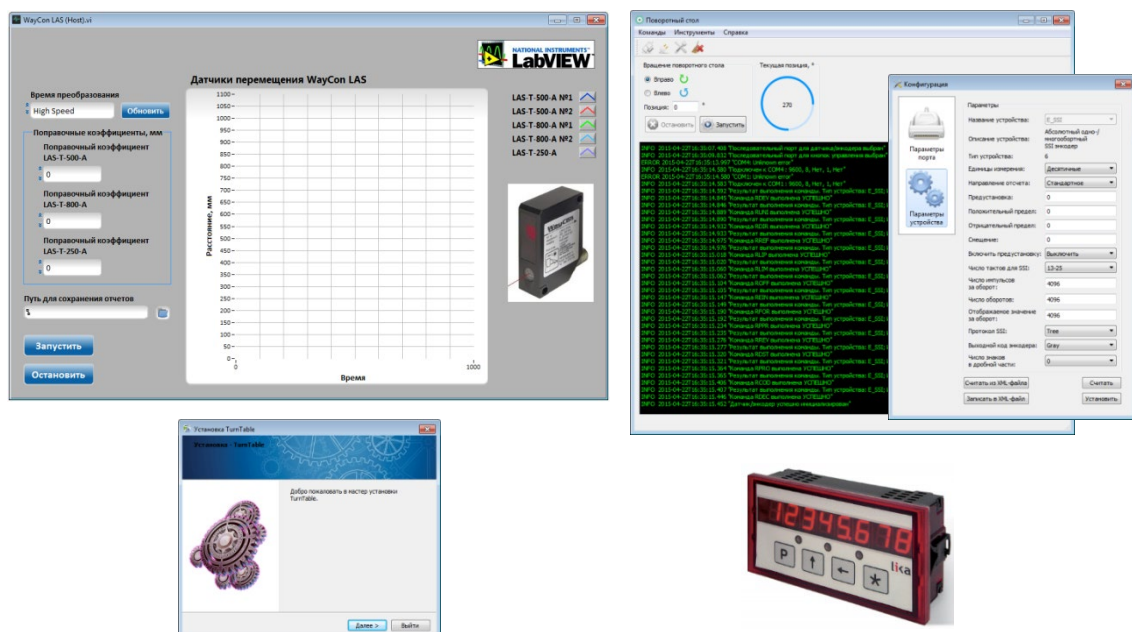

Category: Application Programming

Company: Moscow Scientific Research Television Institute, Moscow, Russia

Technology: NI LabVIEW, C++, Qt, Qt Installer Framework

Description:

Aerodynamic measurements control software was developed and tested for Windows platform. The software is used to implement a physical modeling of wind impact on buildings. A model is positioned at the center of a turntable that can be rotated to simulate wind approaching from any azimuth. The model is geometrically scaled to a building. An application software for laser sensors that detect a distance to the model was implemented in the NI LabVIEW IDE. The laser sensors are connected to a NI chassis with FPGA that interacts with PC by Ethernet. Results are saved in Excel files. A turntable management application was realized within the Qt Creator IDE using C++. Commands between PC and the turntable are transmitted via a serial port and a universal position display.

24. Algorithm of Character Recognition

Period: March 2013 – June 2014

Category: Algorithm Design and Implementation, Research and Development Project

Company: Moscow Scientific Research Television Institute, Moscow, Russia

Technology: C++, OpenCV, Qt, Qwt, XML, SQL

Description:

Utilized algorithm design principles and theories to implement a correlation algorithm of character recognition in TV images from satellites. It is used for extraction of telemetry data using binary patterns of characters. Segmentation of characters is performed via contours. To determine the degree of closeness of input image and template is used the cross-correlation with FFT. The algorithm was written in C++. Some steps of this algorithm have been implemented using the OpenCV computer vision library. Recognition results are stored in SQL database. The app processes a real-time video stream. The program utilizes a multi-threaded processing of all parameters. Its complexity and performance were evaluated against other image recognition solutions. The project was developed in the Qt Creator IDE for Windows platform.

25. Widget for Samsung Smart TV

Period: June 2012 – November 2012

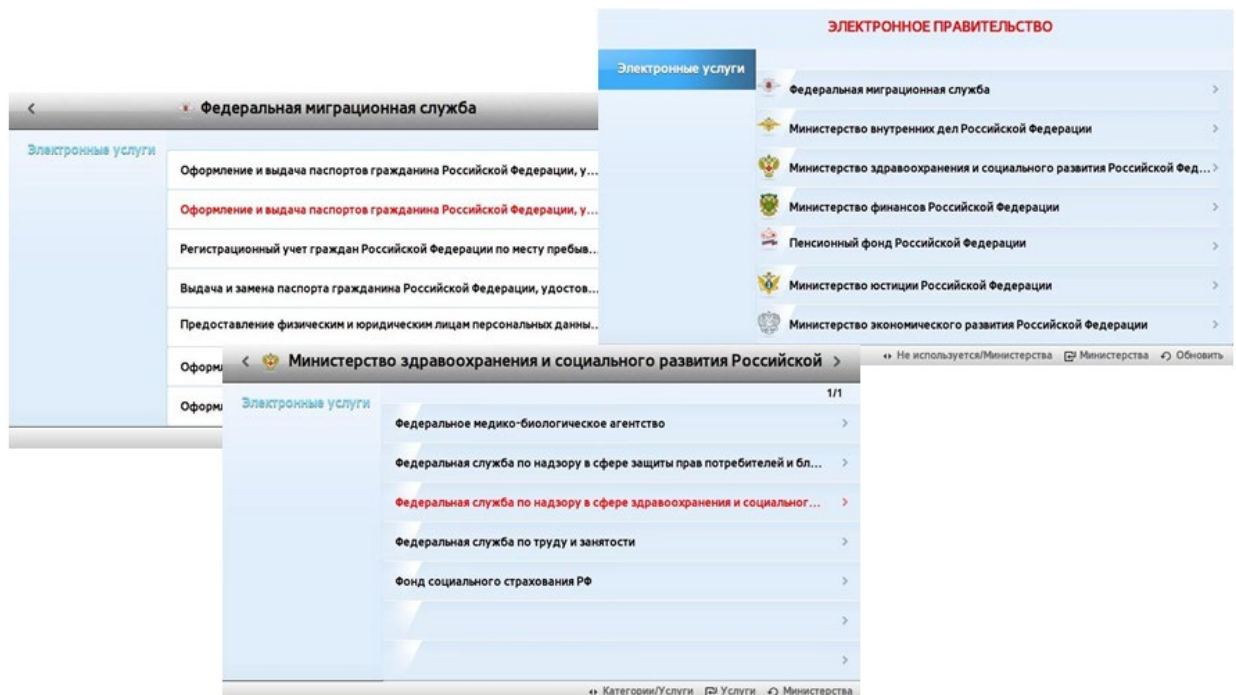

Category: Web Development

Company: Moscow Scientific Research Television Institute, Moscow, Russia

Technology: HTML, JavaScript, XML, AJAX, CSS, Eclipse, Samsung Smart TV SDK

Description:

Designed, developed and tested a widget for Samsung Smart TV scripted in JavaScript. The widget was designed to provide a simple and easy-to-use way of giving information about the public services in Russia. The app displays the structure of ministries and departments, the list of services and information about them. Other web technologies: resources are extracted from XML files via AJAX requests. The widget is managed by remote control. The project was developed within the Eclipse IDE included Samsung Smart TV SDK.

26. Porting Device Drivers

Period: January 2012 – May 2012

Category: Device Driver Development

Company: Moscow Scientific Research Television Institute, Moscow, Russia

Technology: C, C++, Shell script, Linux I2C Core, Embedded Linux, SVN

Description:

Frontend (tuner and demodulator) drivers were integrated in DVB-T and DVB-T2 set-top boxes based on Renesas platform with Embedded Linux. Used two frontends:

1) MaxLinear tuner and Sony demodulator; 2) DiBcom tuner and demodulator. Each frontend has two channels (two tuners and two demodulators). The demodulators are connected to a set-top box CPU by I2C bus. The set-top box CPU is a master, the demodulators are slaves. Each tuner is joined with demodulator by I2C bus. Each demodulator is a gateway for appropriate tuner. Software was written in C and C++. Used Linux I2C Core. A kernel module wrapper calls open demodulator functions and interacts with user space.

Name	Size	Modify time
adapter	0	Jul 2 2014

rnc_dvbt_main.h	10146	Oct 4 2010

27. Software Engineering for Microcontrollers

Period: August 2009 – July 2010

Category: Microcontroller Programming, Embedded Software Development, Low-Level Debugging

Company: Moscow Scientific Research Television Institute, Moscow, Russia

Technology: C, I2C, IAR Embedded Workbench EW78K, Green Hills Multi, SVN

Description:

Developed and tested software for a front panel of digital set-top box in IAR Embedded Workbench EW78K IDE using C language. A model is based on Renesas Electronics components. A microcontroller of front panel interacts with an LED indicator driver and a set-top box CPU by I2C bus. The app controls and synchronizes the current time, processes key presses, decodes a remote control signal by Philips RC-5 protocol, supports standby. Developed a communication protocol between the set-top box CPU and the micro of front panel. Software for the set-top box CPU was developed in Green Hills Multi IDE. Oscilloscope was applied to low-level debugging. The developed software is used in two set-top boxes (DVB-T and DVB-T2) based on different Renesas Electronics chipsets.

28. Software for Researching of Solar Panels

Period: February 2009 – May 2009

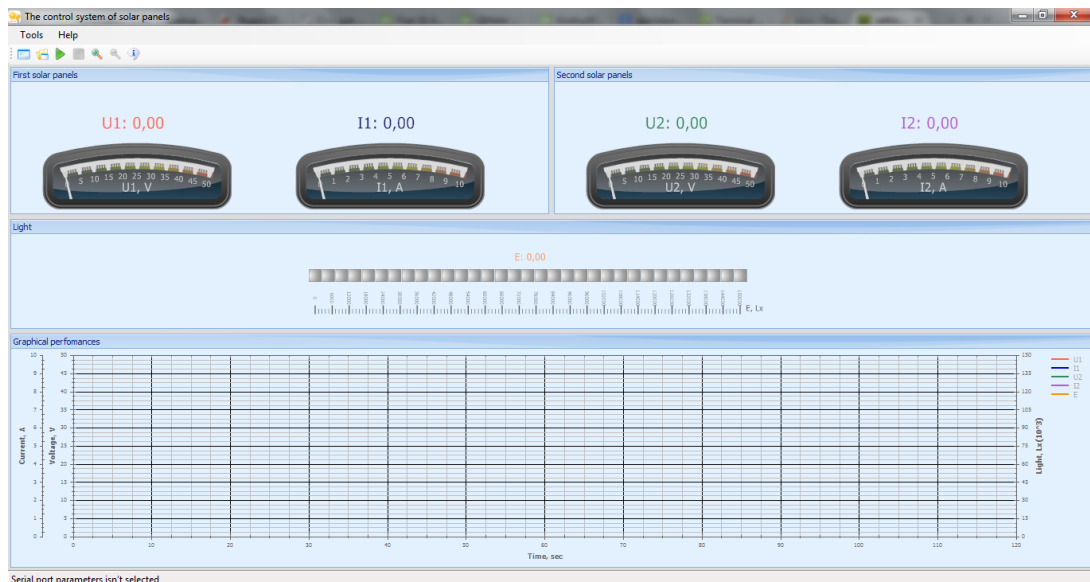

Category: Research and Development Project

Company: Bauman Moscow State Technical University

Technology: C#, Windows Forms, InteropServices (Excel), Visual Studio, InstallShield

Description:

An application for researching the level of insolation and efficiency solar panels was developed and tested. The app was written in C#. It controls an output current of solar panels and a voltage of panels from sensors through a serial port. The data is saved in an Excel file, where is calculated the hourly capacity and are built some graphs. The project was developed within the Visual Studio IDE. The necessary calculations for the real efficiency estimation of solar panels were implemented.

29. System of Confidentiality Protection and Data Integrity

Period: January 2008 – November 2008

Category: Application Programming, Architecture Design, Database Development, Installer Development, Testing

Company: Perimetrix, Moscow, Russia

Technology: C++, C#, STL, WinAPI, MFC, UML, SQLite, Visual Studio, WinDbg, SVN, InstallShield, Active Directory, Scrum

Description:

Participated in Perimetrix SafeSpace Data Loss Prevention System developer team. I took an active part in a Perimetrix SafeEdge subsystem development. It is a real-time monitoring system for all documents leaving the corporate network perimeter which automatically filters and classifies outgoing documents. This product ensures a protection of data in motion. I developed a client driver, a test utility, static and dynamic class diagrams, GUI, an installer, unit tests and database structure. I also performed testing product modules. I implemented software in C++ and C#. The project was developed within the Visual Studio IDE. Our team used the Scrum software development methodology.

30. Test-System for a Computing Complex

Period: March 2007 – January 2008

Category: Test-System Development

Company: MCST, Moscow, Russia

Technology: C, Shell script, Linux, CVS

Description:

Worked within a team responsible for software development and testing of a computing complex. Developed and modified tests for main devices this system using C language and Shell script. Installed and configured Linux operating system. I also developed a system for an automation of assemblage and installation Linux kernels using Shell script.

31. Publications

1. Hardware and software development of unified module of management and indication panel for digital set-top-box, 2010.
2. The practical aspects of hardware and software development of unified front panel module for digital set-top-boxes, 2012.
3. Smart TV applications development experience, 2012.
4. Operational selection of telemetry data in TV images, 2013.
5. Recognition of character information in TV images using binary templates, 2014.
6. A recognition system of character information in TV images, 2014.
7. Correlation algorithm of character information recognition in TV images, 2014.

32. Accomplishments

1st prize in Temryuk City Junior Physics Olympiad, Krasnodar Region, Russia, 2000

2st prize in Temryuk District Junior Physics Olympiad, Krasnodar Region, Russia, 2000

3st prize in Slavyansk-na-Kubani Area Junior Physics Olympiad, Krasnodar Region, Russia, 2000

1st prize in Temryuk District Junior Physics Olympiad, Krasnodar Region, Russia, 2002

3st prize in Programming & Research Contest of Young Specialists, Moscow Scientific Research Television Institute, Moscow, Russia, 2014
